Intern Role: BLUE TEAM INTERN

SIEM Home Lab Project Report

Overview:

Built a small-scale SOC lab using Linux Mint as the Wazuh Manager, Kali Linux as an attacker, and Windows 10 as a monitored endpoint. Configured dual network adapters on each VM—Host-Only for internal lab communication and NAT for internet access—and assigned static IPs for reliable connectivity. Set up proper routing so all machines could reach each other and the internet. Deployed Wazuh agents on Kali and Windows, generated test attacks such as SSH login attempts, and monitored them on the Wazuh dashboard. Documented the workflow from event generation to alert triage, including rule IDs, severity, and system behavior, demonstrating practical knowledge of networking, endpoint monitoring, and entry-level SOC operations.

Lab Architecture:

The lab consists of three virtual machines running inside VirtualBox:

1. Linux Mint – Wazuh Manager, Indexer, and Dashboard
2. Kali Linux – Attacker machine
3. Windows 10 – Monitored endpoint

Each machine uses two network interfaces:

• NAT Network Adapter – Provides internet access

• Host-Only Adapter – Allows isolated communication between lab machines

Machine 1 – Wazuh Server (Linux Mint):

System Role

This machine hosts the Wazuh SIEM infrastructure including:

- **Wazuh Manager:**

Virtual Machine Settings

- OS: Linux Mint
- RAM: 8GB
- CPU: 4
- Storage: 50GB

Machine 2 – Kali Linux (Attacker Machine):

System Role

This system simulates attacker behavior to generate security events for the SIEM.

Virtual Machine Settings

- OS: Kali Linux
- RAM: 3GB
- CPU: 3
- Storage: 50GB

Wazuh Agent Installation

Commands used:

- wget https://packages.wazuh.com/4.x/apt/pool/main/w/wazuh-agent/wazuh-agentamd64.deb
  sudo WAZUH_MANAGER='xyz' WAZUH_AGENT_NAME='KaliAttacker' dpkg -i wazuh-agent.deb

Enable service:

- sudo systemctl enable wazuh-agent
- sudo systemctl start wazuh-agent

```
┌──(kali㉿kali)-[~]
└─$ sudo systemctl status wazuh-agent
[sudo] password for kali:
● wazuh-agent.service - Wazuh agent

Machine 3 – Windows 10 (Monitored Endpoint):

System Role

This system acts as a monitored workstation generating logs for analysis.

Virtual Machine Settings

- OS: Linux Mint
- RAM: 3GB
- CPU: 3
- Storage: 50GB

Wazuh Deployment:

The Wazuh platform consists of three main components that work together to monitor, analyze, and visualize security events across systems. These components include the Wazuh Manager, Wazuh Indexer, and Wazuh Dashboard.

1) Wazuh Manager

The Wazuh Manager acts as the central component of the platform. It is responsible for collecting logs from different systems and agents connected to the network. After collecting the logs, the manager performs rule-based analysis to detect suspicious or malicious activities. Based on this analysis, it generates alerts that help security analysts identify potential threats and incidents.

2) Wazuh Indexer

The Wazuh Indexer is responsible for storing and organizing the event data generated by the Wazuh Manager. It indexes the collected logs and alerts so they can be efficiently searched and analyzed. This allows security teams to quickly investigate events, perform threat hunting, and review historical security data.

3) Wazuh Dashboard

The Wazuh Dashboard provides a graphical user interface that allows users to interact with the Wazuh platform. Through the dashboard, users can visualize alerts, monitor logs, review security events, and analyze system activity in an organized and user-friendly way.

Dashboard Access:

The Wazuh Dashboard can be accessed through a web browser using HTTPS. It operates on port 443, which ensures secure communication between the user and the dashboard interface.

Attack Simulation – SSH Brute Force:

To generate security alerts, an SSH brute force attack was simulated from Kali Linux to the Windows 10 Virtual Machine.

Attack Tool

Hydra (SSH brute force tool)
Example command:
hydra -l username -P passwords.txt ssh://**Target IP**
This command attempts multiple password combinations against the SSH service.

Attack Process

1. Kali sends repeated login attempts to the Windows system.
2. Windows logs authentication events.
3. The Wazuh agent collects these logs.
4. Logs are sent to the Wazuh Manager.
5. Wazuh rules detect suspicious login activity.
6. Alerts are generated and displayed in the dashboard.

```
┌──(kali㉿kali)-[~]
└─$ hydra -l username -P password.txt ssh:// [redacted] -V
Hydra v9.6 (c) 2023 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizati
ons, or for illegal purposes (this is non-binding, these *** ignore laws and ethics anyway).

Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2026-03-09 19:11:45

Conclusion

This project demonstrates the deployment of a functional SIEM home lab capable of collecting logs, detecting suspicious activity, and visualizing security alerts. The lab simulates a basic SOC environment with attacker activity, monitored endpoints, and centralized analysis using Wazuh. The project highlights practical skills in virtualization, networking, SIEM deployment, agent configuration, and security event analysis.
